
Toast Documentation

Release 0.1-dev

Chris Trotman

April 10, 2016

1	Installation	3
2	API	5
2.1	Salt entry points	5
3	Indices and tables	7
	Python Module Index	9

Toast is an extension for salt. It contains a `external_tops` extension and an `external_pillar` extension. The main purpose of toast is to provide a completely customisable way of including states depending on the grains of minions. Toast is more powerful than the normal pillar state files, as it exposes a full python interface to you. This allows you to create a hierarchy of minions, simply by implementing classes and subclasses. The sky is the limit, as long as you still return a list of states and a pillar dictionary!

Contents:

Installation

Normal usage of toast should not require you to know how toast works internally. But here is the source documentation anyway.

```
class toast.toast.Toaster(path, grains)
```

```
    load()
```

```
    pillars()
```

```
    states()
```

2.1 Salt entry points

This module contains the entry points for the salt adapters.

```
toast.salt_entry.pillar(__opts__=None, minion_id=None, pillar=None, grains=None, **kwargs)
```

The main entry point for the ext_pillar extension

```
toast.salt_entry.top(__opts__=None, grains=None, **kwargs)
```

The main entry point for the external_tops extension

Indices and tables

- `genindex`
- `modindex`
- `search`

t

`toast.salt_entry`, 5
`toast.toast`, 5

L

`load()` (`toast.toast.Toaster` method), 5

P

`pillar()` (in module `toast.salt_entry`), 5

`pillars()` (`toast.toast.Toaster` method), 5

S

`states()` (`toast.toast.Toaster` method), 5

T

`toast.salt_entry` (module), 5

`toast.toast` (module), 5

`Toaster` (class in `toast.toast`), 5

`top()` (in module `toast.salt_entry`), 5
